## IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A medical system, comprising:

an X-ray CT apparatus configured to detect an X-ray irradiated to an object and obtain a scanogram and an X-ray CT image of the object;

a nuclear medicine apparatus configured to detect a radiation ray irradiated from radioisotope injected to the object and obtain a nuclear medicine image of the object;

a partition configured to block at least one of the X-ray leaking from the X-ray CT apparatus to the nuclear medicine apparatus and the radiation ray leaking from the nuclear medicine apparatus to the X-ray CT apparatus; and

a partition movement unit configured to move the partition; and an operation unit configured to set a position of the nuclear medicine image on the

scanogram.

- 2. (Original) The medical system according to claim 1, further comprising:
- a bed on which the object can be placed; and
- a bed movement unit configured to move the bed between the X-ray CT apparatus and the nuclear medicine apparatus.
- 3. (Original) The medical system according to claim 1, wherein the partition is attachable or slidable or openable.
  - 4. (Cancelled)

- 5. (Original) The medical system according to claim 4, wherein the operation unit is also configured to set a position the X-ray CT image on the scanogram.
- 6. (Original) The medical system according to claim 5, wherein the operation unit is also configured to set the same position of the nuclear medicine image as that of the X-ray CT image.
- 7. (Original) The medical system according to claim 6, further comprising a display unit configured to display an image in which the X-ray CT image and the nuclear medicine image are superimposed.
- 8. (Original) The medical system according to claim 7, wherein the display unit displays the scanogram, the X-ray CT image and the nuclear medicine image.
  - 9. (Original) The medical system according to claim 5, wherein:

the X-ray CT apparatus includes a first light emission device configured to emit a first light to the object to set the position of the X-ray CT image; and

the nuclear medicine apparatus includes a second light emission device configured to emit a second light to the object to set the position of the nuclear medicine image.

10. (Original) The medical system according to claim 9, further comprising a control unit configured to set a basic position when the position of the first light is the same as the position of the second light.

- 11. (Original) The medical system according to claim 5, wherein the nuclear medicine apparatus is a SPECT apparatus.
- 12. (Original) The medical system according to claim 5, wherein the nuclear medicine apparatus is a PET apparatus.
  - 13. (Original) A medical system, comprising:

an X-ray CT apparatus configured to detect an X-ray irradiated to an object and obtain a scanogram and an X-ray CT image of the object;

a nuclear medicine apparatus configured to detect a radiation ray irradiated from radioisotope injected to the object and obtain a nuclear medicine image of the object; and an operation unit configured to set a position of the nuclear medicine image on the scanogram.

- 14. (Original) The medical system according to claim 13, wherein the operation unit is also configured to set a position the X-ray CT image on the scanogram.
- 15. (Original) The medical system according to claim 14, wherein the operation unit is configured to set the same position of the nuclear medicine image as the X-ray CT image.
- 16. (Original) The medical system according to claim 15, further comprising a display unit configured to display an image in which the X-ray CT image and the nuclear medicine image are superimposed.

- 17. (Original) The medical system according to claim 16, wherein the display unit displays the scanogram, the X-ray CT image and the nuclear medicine image.
  - 18. (Original) The medical system according to claim 14, wherein:

the X-ray CT apparatus includes a first light emission device configured to emit a first light to the object to set the position of the X-ray CT image; and

the nuclear medicine apparatus includes a second light emission device configured to emit a second light to the object to set the position of the nuclear medicine image.

- 19. (Original) The medical system according to claim 18, further comprising a control unit configured to set a basic position when the position of the first light is the same as the position of the second light.
- 20. (Original) The medical system according to claim 14, wherein the nuclear medicine apparatus is a SPECT apparatus.
- 21. (Original) The medical system according to claim 14, wherein the nuclear medicine apparatus is a PET apparatus.
  - 22. (Original) A medical system, comprising:

an X-ray CT apparatus configured to detect an X-ray irradiated to an object and obtain a scanogram and an X-ray CT image of the object;

a nuclear medicine apparatus configured to detect a radiation ray irradiated from radioisotope injected to the object and obtain a nuclear medicine image of the object; and means for setting a position of the nuclear medicine image on the scanogram.

23. (Original) The medical system according to claim 22, wherein the setting means comprises:

a keyboard, mouse or trackball input device.

24. (Original) A method for controlling a medical system, comprising:

detecting an X-ray irradiated to an object;

obtaining a scanogram of the object based on the detected X-ray;

setting a position of a nuclear medicine image on the scanogram;

detecting a radiation ray irradiated from radioisotope injected to the object based on the set position; and

obtaining the nuclear medicine image of the object.

25. (Original) An X-ray CT system comprising:

an X-ray detector configured to detect an X-ray irradiated to an object;

an image unit configured to obtain a scanogram of the object based on the X-ray detected by the X-ray detector;

an operation unit configured to set a position of a nuclear medicine image on the scanogram; and

an output device configured to output the position to a nuclear medicine apparatus.

26. (Original) A nuclear medicine system comprising:

an input device configured to input a scanogram obtained by an X-ray CT apparatus; an operation unit configured to set a position of a nuclear medicine image on the scanogram;

Application No. 10/625,785 Reply to Office Action of March 22, 2005

a radiation ray detector configured to detect a radiation ray irradiated from radioisotope injected to the object based on the position set by the operation unit; and an image unit configured to obtain the nuclear medicine image of the object.
